COMMERCIAL VENTILATION SYSTEMS

## HIGH EFFICIENCY INDUSTRIAL AIRFOIL FANS

MODEL HAF

# HAF High Efficiency Industrial Airfoil Fans

Model HAF fans from Twin City Fan & Blower employ a high efficiency non-overloading airfoil wheel in a ruggedly constructed fan housing. These fans are designed to handle clean air.

## Typical Applications

- Product cooling
- Fluidizing systems
- Solvent recovery systems
- Moisture blow-off
- Forced draft
- Dryer applications
- Recirculation systems

## Standard Features

- Heavy-gauge, all welded, high efficiency, non-overloading airfoil wheels are provided on all sizes and arrangements.
- Statically and dynamically balanced rotor assembly.
- Heavy duty self-aligning grease lubricated anti-friction pillow block bearings. See page 7 for sizes and types.
- Shaft turned ground, polished, and straightened to close tolerances.
- Heavy-gauge reinforced housing and bearing pedestal for vibration-free service.
- All arrangements include our standard shaft seal.
- Flanged inlet and outlet.
- Lifting lugs.

## Capabilities

- Air flow up to 160,000 CFM
- Wheel diameters from 25" to 82"
- High temperature construction to 600°F available

### Class 30

- Suitable to 23,000 FPM tip speed
- Pressure to 30" w.g.

### Class 40

- Suitable to 27,800 FPM tip speed
- Pressure to 40" w.g.

### Class 50

- Suitable to 29,700 FPM tip speed
- Pressure to 50" w.g.

*Arrangement 4 on Isolation Base*

*HAF High Efficiency Airfoil Wheel*

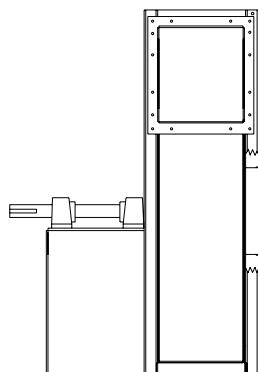

# Arrangements

## Arrangement 1

The usual choice for many V-belt drive applications. Wheel is overhung with two bearings on the base. The motor can be mounted in any of the four AMCA standard motor positions, w, x, y or z. Arrangement 1 is also available as a direct drive with a concrete motor pedestal by others.

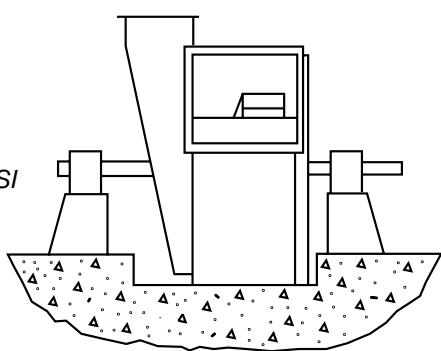

Arrangement 1

## Arrangement 3SI

Single-width, single-inlet fan with integral inlet box and two independent bearing pedestals. The wheel is supported between two bearings.

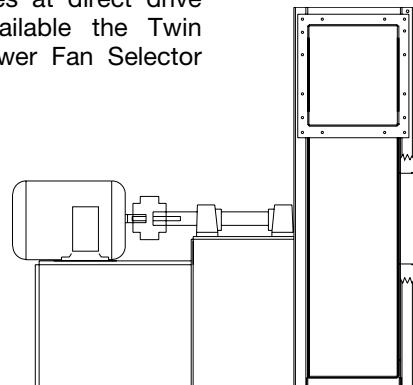

Arrangement 3SI

## Arrangement 8

Direct coupled with a flexible coupling. Variations in wheel widths are available to match designed performance at motor speeds. Characteristic curves showing performances at direct drive speeds are available the Twin City Fan & Blower Fan Selector Program.

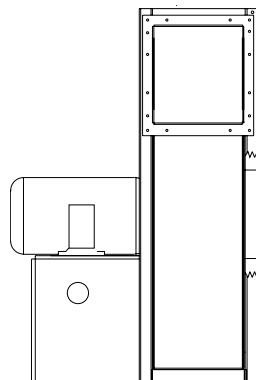

Arrangement 8

## Arrangement 4

Arrangement 4 is available in direct drive only. The fan wheel is mounted directly on the motor shaft with the motor mounted on a pedestal. An Arrangement 4 design offers low maintenance as there are no fan bearings, fan shaft or drive parts to maintain.

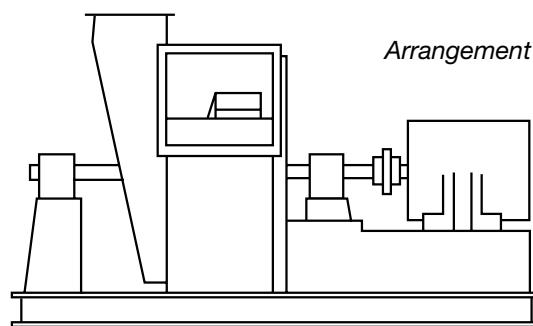

Arrangement 4

## Arrangement 7SI

Direct coupled with a flexible coupling. A single-width, single-inlet fan with an integral inlet box and independent bearing pedestal and bearing/motor pedestal installed on a common base. The wheel is supported between two bearings.

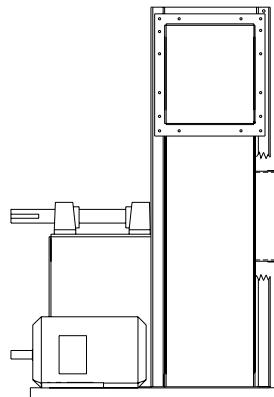

Arrangement 7SI

## Arrangement 9F

Arrangement 9F uses an extended fan base to accommodate the motor for horizontal mounting, similar to an Arrangement 1 fan. Typically, the motor is mounted on the left side of the pedestal for CW rotation, and the right side for CCW rotation.

Arrangement 9F

# Accessories

## Inlet Box Dampers

Pre-spin design, heavy-duty construction. Provides a convenient and efficient means of reducing performance by spinning air in the direction of wheel rotation, resulting in power savings.

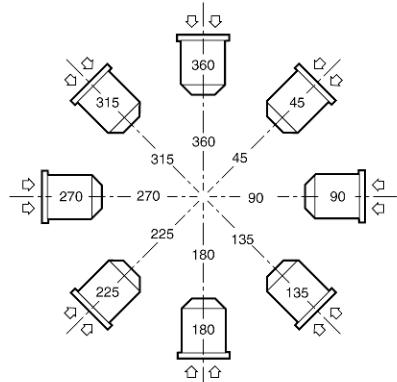

## Evasé

Usually fabricated by customer as part of the ductwork. **Fan outlet must be expanded to equal evasé area shown in the catalog to obtain rated performance.** Same gauge as fan housing when purchased from the factory. (Do not use if ductwork is smaller than evasé.)

## Inlet Boxes

Integral or detached type generously designed to minimize pressure drop.

## Inlet Box Positions For Centrifugal Fans

### INLET BOX POSITIONS AND DESCRIPTIONS

45 —	Angular Down Intake
90 —	Horizontal Right Intake
135 —	Angular Up Intake
180 —	Bottom Up Intake
225 —	Angular Up Intake
270 —	Horizontal Left Intake
315 —	Angular Down Intake
360 —	Top Down Intake

Reference line is the Top Vertical Axis through center of fan shaft.

Position of inlet box and air entry to inlet box is determined from drive side of fan.

Position of inlet box is designated in degrees clockwise from Top Vertical Axis as shown.

Positions 135° to 225° in some cases interfere seriously with floor structure.

## Temperature and Vibration Detectors

Thermocouples or RTDs can be installed on the bearings. Various types of vibration switches are also available.

## Shaft and Bearing Guards

Solid sheet metal guards cover shaft and bearings and come with extended lube lines to a common point out either side of the guard. A guard spanning the shaft between the bearings is also available to provide easy access to bearings for lubrication and vibration monitoring.

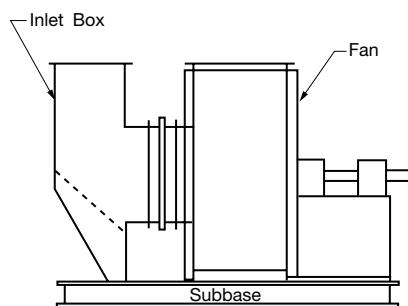

## Drain

A 3/4" NPT threaded pipe coupling welded to the lowest point in the housing scroll. Plug is optional.

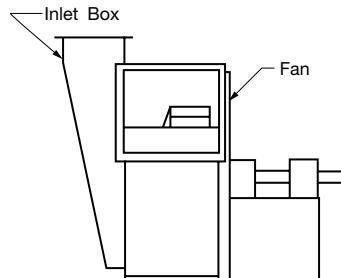

## Inlet/Outlet Companion Flanges

Companion flanges are used for installing the fan to flexible sleeve connections, and are punched to match the fan's inlet or outlet.

## Inlet Box Arrangements

Fan with detached inlet box (shown with optional sub base). Available on Arrangements 1, 4, 8 and 9F.

Fan with attached or integral inlet box. Available on Arrangements 1, 4, 8 and 9F. Standard on 3SI and 7SI.

## Bolted or Raised Bolted Access Door

Bolted access door mounted flush, or raised to allow for insulation. Due to high operating pressures, a quick opening access door is not available.

# Accessories

---

## Oil Circulation Unit

Force feed lubrication units can be supplied for applications that require oil circulation for bearings.

## External Variable Inlet Vanes

Works on the same principle as inlet box dampers. Only external bolt on type variable inlet vanes are available.

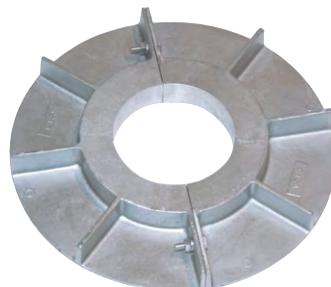

# Optional Construction

---

## High Temperature Modifications

Air stream temperatures of 301-500°F are modified to use high temperature grease, expansion and non-expansion bearings and shaft cooler. TCF&B standard paint is suitable up to 500°F. Air stream temperatures of 501-600°F use the same construction as above with the addition of high temperature paint. Consult factory for applications above 600°F. Arrangement 4 fans are not suitable for applications above 150°F.

## Vibration Isolation Bases

Heavy structural base for fan, motor and drive is designed for use with spring or rubber-in-shear type isolators. Use of flexible connectors at inlet and outlet is required on fans with isolators.

## Outlet Dampers

The closing of the damper adds to the resistance that the fan is working against. This moves the operating point to the left of the initial rating point. The savings in horsepower depends on the relative position on the fan curve and is usually much less than offered by other methods. Outlet dampers are typically the least expensive option and should be considered when infrequent operation at lesser capacity is desired or when handling hot, humid or particulate laden air.

There are two types of outlet dampers: parallel blade and opposed blade.

**Parallel blade dampers** are recommended for systems where air volume is modulated between full-open to about 75% of open.

**Opposed blade dampers** cost about 10% more and are recommended for systems where volume is modulated over the entire range. Opposed blades reduce air volume in a closer relationship to the control arm movement.

## Belt Guards

A belt guard protects personnel from the moving drive parts. Both standard and totally enclosed type guards are available.

## Spark Resistant Construction

Type 'C' spark resistant is available per AMCA standard 99-0401-86. Twin City Fan offers type 'C' suitable to 600°F. Consult factory where nonferrous metal other than aluminum is specified. Type 'B' is NOT available.

## Unitary Base

A structural steel base provides common support to fan, motor, and drive including guards. This style of base is designed for use without isolators and requires adequate foundation integrity (provided and designed by others) for proper installation, and vibration free fan operation.

## Split Housings

Size 220-330 fans are designed to permit wheel removal through the fan inlet. Sizes 360 and larger are standard with a pie-shaped split housing, which allows removal of the wheel and shaft without disconnecting the inner and outlet ductwork. A pie-split housing is required with fans utilizing an integral inlet box.

# Engineering Data

## Performance Correction for Temperature and Altitude

The performance tables in this catalog are based on fans handling standard air at a density of 0.075 pound per cubic foot. This is equivalent to 70°F at sea level (29.92" Hg barometric pressure). When specified performance is at a density different than standard, it must be converted to the equivalent standard conditions before entering the performance tables. The equivalent standard conditions can be calculated by using the "Temperature and Altitude Correction Factors" from the table below.

### Temperature and Altitude Correction Factors

AIR TEMP °F	ALTITUDE IN FEET ABOVE SEA LEVEL												
	BAROMETRIC PRESSURE IN INCHES OF MERCURY												
	29.92	28.86	27.82	26.82	25.84	24.90	23.98	23.09	22.22	21.39	20.58	16.89	13.75

800	0.420	0.404	0.389	0.375	0.362	0.350	0.336	0.323	0.311	0.300	0.290	0.237	0.193

### Example:

Assume a Model HAF 540 to handle 82,000 CFM at 14" SP at 400°F at an altitude of 3,000 feet.

- Knowing the operating conditions are 400°F and 3,000 feet altitude, the correction factor can be found in the table above to be 0.552.
- Divide the operating SP by this factor:

$$14" \div 0.552 = 25.4" \text{ SP}$$

This is the equivalent SP at standard air density.

- Enter the HAF 540 performance table with 82,000 CFM and 26" SP to find the fan RPM and BHP.

The fan RPM is 1389. The brake horsepower is 392.21 BHP at standard conditions (392.21 BHP is also referred to as "cold" or "starting" brake horsepower).

To determine the BHP at operating conditions, multiply the BHP at standard conditions by the correction factor from the table above (392.21 x 0.552 = 216.50). The BHP at operating conditions is 216.50 BHP.

## Derating Factors For High Temperature

TEMP. (°F)	DERATE FACTOR
70	1.00
200	0.96
300	0.94
400	0.92
500	0.90
600	0.87

Standard steel construction is suitable for use in gas temperatures to 600°F. When a fan operates at temperatures higher than 70°F, the maximum RPMs allowable from the table to the left must be adjusted according to the derating factor found in the table at the left.

# Engineering Data

## Safe Wheel RPM's for HAF at 70°F (Use for Temperature Derating of wheel only)

SIZE	WHEEL DIAMETER	CLASS 30	CLASS 40	CLASS 50
220	25.00	3410	4000	4367
240	27.50	3100	3700	3970
270	30.38	2806	3349	3594
300	33.50	2545	3037	3259

Fans with brake horsepower (BHP) of over 1,000 requires independent bearing pedestals and motor mounted on a concrete pier, provided by others.

\* Wheel requires percent width to reach speed.

† Bearings will require static oil lubrication.

See notes on page 17 for further details and other limitations.

1 - Refer to tables on p. 7 for bearing RPM limits and selection.

2 - Bearing is SRB for static oil lubrication also

3 - First number is diameter at drive bearing, second number is diameter at inboard bearing.

RB = Unit Roller Bearings

HDB = Heavy Duty Ball Bearing

SRB = Spherical Roller Bearing with Split Pillow Block Housing

## Additional High Pressure Fans

### BCS

High efficiency, backward curved fan for relatively clean air in high pressure applications. Capacities to 270,000 CFM, pressures to 40" w.g. Additional information can be found in Bulletin 400.

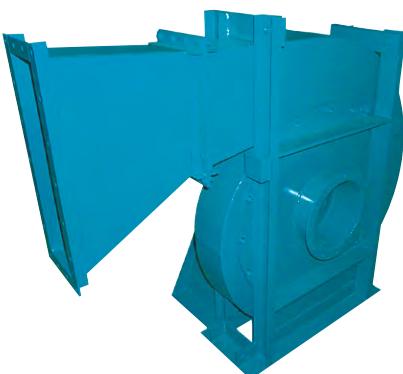

### HIB

Designed to handle clean to light dust loaded air. Backward curve design. Capacities to 177,000 CFM, pressures to 40" w.g. Additional information can be found in Bulletin 1100.

### MBR

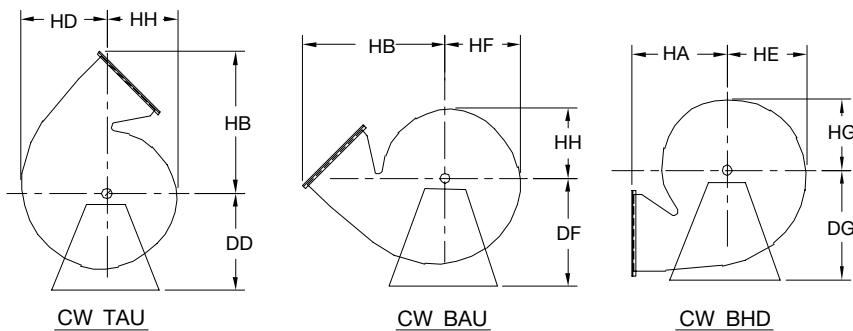

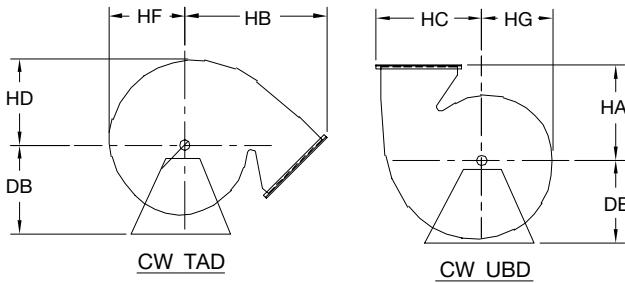

Radial bladed wheel designed to handle clean, hot or particulate-laden air. Capacities to 19,000 CFM, pressures to 125" w.g. Additional information can be found in Bulletin 1400.

### BCN

High efficiency, backward curved fan suitable for industrial processes involving clean as well as light particulate-laden air in high pressure applications. Capacities to 75,000 CFM, pressures to 100" w.g. Additional information can be found in Bulletin 1450.

Outlet flange furnished as standard

# Typical Specifications

---

Furnish and install as indicated on the plans, Twin City Fan and Blower model HAF industrial duty airfoil fans.

**HOUSING** — Fan housings shall be made of heavy-gauge steel with continuously welded construction and braced with structural shapes to eliminate any resonant vibration and provide smooth operation. Sizes 360 and larger will be furnished with a pie-shaped split as standard. The housing split shall be fully gasketed and bolted together to prevent any leaks. Flanged inlet and outlet shall be provided as standard equipment. Bearing support members shall be fabricated of heavy steel shapes or made of concrete to ensure maximum rigidity.

**WHEEL** — Blade design shall be airfoil for high efficiency and have non-overloading performance characteristics. Blades shall be die-formed of special alloy material for strength and accuracy of contour and continuously welded to the wheel inlet cone and backplate. A heavy fabricated steel (not cast iron) hub shall be provided. Wheels shall be shrunk fit on the shafts, and hubs shall include puller holes for use in the event of wheel removal. Wheels shall be statically and dynamically balanced on precision electronic machines, as well as balance tuned after complete assembly.

**SHAFT** — Shafts are to be solid AISI 1040 or 1045 hot rolled steel, accurately turned, ground, polished, and ring gauged for accuracy.

**BEARINGS** — Fans shall be supplied with heavy duty, self-aligning, grease lubricated, anti-friction, pillow block type bearings selected for a minimum average bearing life (AFBMA L-50) in excess of 200,000 hours at the maximum fan RPM. Sizes 220 through 540 are supplied with ball or roller bearings. Sizes 600 through 730 are supplied with spherical roller bearings with split pillow block housings. Where required, sleeve bearings may be used with appropriate cooling method for high carrying loads.

**DRIVE** — Motor and fan sheaves shall be cast iron. Drives and belts are to be located external to the fan casing and rated for 150% of the required motor HP.

**FINISH & COATING** — The entire assembly, excluding the shaft, shall be thoroughly degreased and deburred before application of a protective coating which is applied to the entire assembly. The fan shaft should be coated with a petroleum-based rust protectant.

**ACCESSORIES** — When specified, accessories such as belt guards, access doors, companion flanges, variable inlet vanes, outlet dampers, inlet boxes, inlet box dampers, evasés, evasé dampers, shaft coolers, shaft seals, closure plates, inlet screens, drains, etc., shall be provided by Twin City Fan & Blower to maintain one source responsibility.

**FACTORY TEST RUN** — All fans prior to shipment shall be completely assembled and test run as a unit at operating speed or maximum RPM allowed for the particular construction type. Each wheel shall be statically and dynamically balanced to balance grade G6.3 or better per ANSI S2.19. Balance readings shall be taken using electronic type equipment and records shall be maintained of the readings of axial, vertical, and horizontal direction on each of the bearings. A written copy of this record shall be available upon request.

**GUARANTEE** — Manufacturer shall guarantee the workmanship and materials for its High Pressure Industrial Airfoil Bladed Fans for at least one (1) year from startup or eighteen (18) months from shipment, whichever occurs first.
