COMMERCIAL VENTILATION SYSTEMS

AXIFAN® VANEAXIAL & TUBEAXIAL FANS

TCVS/TCTS | TCVSSH/TCTSSH

Models

TCVS | TCTS | TCVSSH | TCTSSH

TCVS

Models TCVS and TCTS are available with the UL/cUL 705 listing for electrical, File No. E158680.

Models TCVSSH and TCTSSH are UL/cUL listed for Smoke Control Systems as standard, File No. MH-29313, 500°F for 4 hours and 1000°F for 15 minutes.

Guide Vanes

TCVS vaneaxial fans are fitted with straightening guide vanes. The vanes are aerodynamically placed within the housing on the discharge side of the wheel. Vanes are stationary and welded to both the inner and outer cylinders. The straightening effect of the vanes aids in minimizing turbulence downstream from the fan thereby recovering rotative energy imparted to the air by the wheel.

AXIFAN® Steel Wheel

AXIFAN® steel wheels are manufactured with a spun steel hub. Steel blades are welded to the hub and can be attached at precise angles ranging from 30° to 50°. This ability to customize blade angles provides the highest efficiency for a given performance.

For applications requiring extensive corrosion resistance or operation at higher temperatures than standard, the Arrangement 9 TCVS/TCTS AXIFAN® is the perfect choice. Standard construction is good for operation to 200°F; fans can be customized to handle up to 300°F. Steel construction is standard, all stainless steel construction is available. Driven by either a fixed or adjustable V-belt drive system, the exact point of rating can be achieved. A future change in rating can be accomplished through a simple sheave change.

TCVSSH/TCTSSH (Smoke & Heat Removal)

Specifically designed for smoke control applications. UL/cUL listed for smoke control systems for 500°F for 4 hours or 1000°F for 15 minutes.

Housing

Fan housings are constructed of continuously welded, heavy gauge steel for strength and rigidity. Flanges on both the inlet and outlet are integrally rolled and punched for attachment to ductwork or accessories.

Shafts

Fan shafts are ground and polished 1045 steel sized to allow the rotating assembly to operate a minimum of 43% below the first critical speed.

Bearings

Cast iron, re-greasable flange mounted ball or roller type bearings have a minimum L-10 life of 40,000 hours. This is equivalent to an average life of 200,000 hours. Extended lubrication lines terminate at the housing exterior.

Drive Isolated from Airstream

The shaft and bearing assembly is mounted within the inner cylinder to isolate these components from the high velocity airstream. The V-belt drive assembly is extended through a two-piece belt fairing. The belt fairing is an aerodynamically designed tube, designed to maximize fan efficiency, minimize air blockage, and reduce noise generation.

Hub-to-Tip Ratio

AXIFAN® wheels are manufactured from one of four hub sizes. Hubs are machined and cut to the specified diameter for a job. Blades are die-formed stamped steel and custom cut to their specified size. Fabricating wheels from custom sized blades and hubs allows the creation of wheels with an infinite range of hub-to-tip ratios. Since each hub-to-tip ratio has a slightly different pressure/efficiency characteristic, the freedom of having several wheels with different hub-to-tip ratios for a set diameter allows maximum efficiency at the required point of rating. For additional hub-to-tip ratios refer to the Twin City Fan & Blower Fan Selector Program.

Motors

A variety of single- and three-phase motors is available in open drip-proof (ODP), explosion-proof (EXP), and totally enclosed fan cooled (TEFC) enclosures. An adjustable mounting platform pivots to allow infinite belt tension adjustment.

ACCESSORIES

Inlet Bell

For systems with no ductwork on the fan inlet, it is required to install an inlet bell to avoid inlet losses. The inlet bell is a torosoidal shape to provide a smooth entrance to the fan. Inlet bells are flanged and drilled to mate with the fan's flanged inlet.

Inlet Bell

Inlet/Outlet Cone

A round-to-round transition bolted to the inlet or discharge flange of the fan housing provides a smooth connection of the fan to larger or smaller ductwork. Cones are flanged on both ends and drilled to mate with the fan's flange. Cones are available with an access door if required. Outlet cones can be utilized to affect performance and transform velocity pressure into static pressure.

Inlet/Outlet Cone

Companion Flanges

For ease of installation of adjacent ductwork, companion flanges can be provided. Flanges are rolled angle rings, drilled to match the fan's inlet or outlet flange.

Companion Flanges

Variable Inlet Vane

For frequent or continuous volume control a variable inlet vane can be provided. The vane action during dampering works to spin the air in the direction of the wheel rotation, thus resulting in lower power consumption.

Variable inlet vanes are available for each specific fan size and are bolted to the fan's flanged inlet. The variable inlet vane's inlet is flanged and drilled to accept ductwork or an inlet bell as the system requires. The vane mechanism is outside of the airstream and is controlled by a single vane lever. Variable inlet vanes can be set up for manual or automatic operation.

Variable Inlet Vane

Sound Attenuation

For applications requiring quiet operation, custom-built attenuation packages can be provided on the fan inlet or outlet. Attenuators are aerodynamically and acoustically matched to the specific system requirements and are designed to significantly reduce noise while adding only minor resistance to airflow.

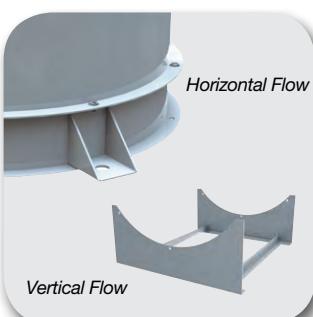

Sound Attenuation

Support Legs

Horizontal Flow

For horizontal flow with floor mounting, support legs are welded to the fan flange with bolt holes aligned for connection of ductwork.

Horizontal Flow

Vertical Flow

For vertical flow with either floor or ceiling mounting, support legs are welded to the fan housing for four-point support. See page 13 for a description of how to identify the location of the legs.

Vertical Flow

Suspension Clips

For horizontal flow with ceiling mounting, four clips of formed angle are welded to the fan housing for suspension via ties to the ceiling support structure.

Suspension Clips

Vibration Isolation

All AXIFAN® fans can be provided with spring or rubber-in-shear isolators as an option. Spring isolators are standard 1" in deflection and can be provided for floor mount or ceiling (hung) orientation. Use of isolators requires flexible duct connectors on attached ductwork. Avoid flexible connectors, which can collapse on the inlet side of the fan.

Vibration Isolation

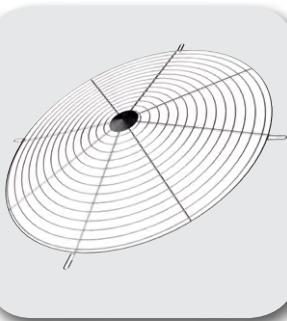

ACCESSORIES

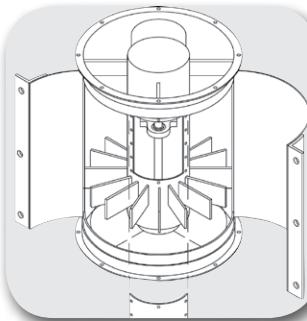

Belt Guard

Weather Cover

Screening

Clamshell Construction

Housing Door

Shaft Seal

Discharge Cap

Curb Cap

Belt Guard

For Arrangement 9 belt driven fans, the belt guard encloses the motor sheave and V-belts. The guard is easily removable for inspection and maintenance.

Weather Cover

For outdoor installations, the weather cover completely encloses the motor and V-belt drive from the elements. Provided with slots for ventilation, the cover is easily removable for inspection and maintenance. Weather covers are available for either horizontal or vertical flow fans.

Screening

Safety screening can be provided for installation in the fan inlet, fan outlet, cone, or bell.

Clamshell Construction

Clamshell construction provides complete accessibility to the internal components of the fan.

Housing Doors

General Observation Door

For inspection and maintenance of the internal section (V-belt drive area) of AXIFAN® units, a general observation access door can be provided. Doors are 5" x 5" for fans sizes 12" to 18" and 8" x 8" for all others. Doors are gasketed, single-skinned, and bolted in place to the housing exterior. As standard, doors are located adjacent to the motor base.

Wheel Area Door

Similar in size and attachment to the general observation access door, a wheel area access door is also available. Wheel area doors differ from general observation doors in that they are double-skinned to maintain a flush surface to the housing interior, thus eliminating the pressure losses resulting from a single-skinned door in this critical pressure developing area.

Shaft Seal

To limit air entering the inner cylinder and avoid contact of airstream contaminants with the bearings and V-belt drive, a shaft seal can be provided. The shaft seal consists of a non-asbestos rubbing ring at the wheel end of the inner cylinder held in place by a cover plate. Please note that a shaft seal does not make the inner cylinder gas tight.

High Temperature Construction

AXIFAN® units can be customized to handle up to 300°F continuous in the airstream.

Discharge Cap

AXIFAN® units can be provided with a discharge cap for rooftop mounting. Discharge caps are designed for vertical discharge with two backdraft dampers to seal out the weather when the fan is shut off. See page 6 for minimum flow (CFM) requirements.

Curb Cap

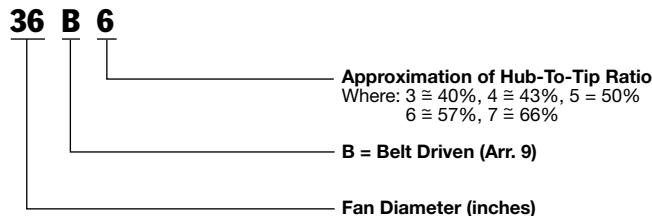

AXIFAN® units can be supplied with a base (curb cap), attached to the fan's flange for curb mounting. The combination of a curb cap and discharge cap creates an upblast-style power roof ventilator.

UL/cUL 705 Listing

Models TCVS and TCTS are available with the UL/cUL 705 listing for electrical when supplied with specific motors. The models TCVSSH and TCTSSH are provided standard with the UL/cUL listing for Smoke Control Systems.

Model Nomenclature

TCVS/TCTS AXIFAN® Arrangement 9 model numbers are represented as follows. Refer to the "Hub-To-Tip Ratio" section on page 2 for an explanation of hub-to-tip ratios.

Useful Formulas

$$\begin{aligned} \text{Total Pressure (TP)} &= \text{Static Pressure (SP)} + \text{Velocity Pressure (VP)} \\ \text{Velocity (Vel.)} &= \frac{\text{CFM}}{\text{Area in ft}^2} \\ \text{Velocity Pressure (VP)} &= \left(\frac{\text{Vel.}}{1096.7} \right)^2 \times \text{Density in lbs/ft}^3 \\ \text{Efficiency} &= \frac{\text{CFM} \times \text{Pressure (in. w.g.)}}{6356 \times \text{Brake Horsepower}} \end{aligned}$$

Where total (or mechanical) efficiency is calculated using total pressure and static efficiency is calculated using static pressure.

Sample Selections

The following examples illustrate conditions that may be encountered with Arrangement 9 TCVS/TCTS AXIFAN® fans. For additional performance corrections refer to the Twin City Fan & Blower Fan Selector Program.

Example 1: Make the most efficient selection for an Arrangement 9 TCVS AXIFAN® at 10,000 CFM and 1.5" SP at standard conditions (0.075 lb/ft³ density). By looking through the TCVS tables for fans that meet this performance we find:

Fan Size	RPM	BHP	Blade Angle
21B6	2024	5.94	48°
24B5	1684	4.36	41°
28B6	1210	3.90	39°
30B4	1494	3.66	33°

Comparing these fans, we find that the 30B4 is the most efficient (lowest horsepower) selection.

Example 2: Make the optimum selection for an Arrangement 9 TCTS AXIFAN® at 11,000 CFM and 1.5" SP at 150°F and 10,000 feet elevation. Using the "Temperature and Altitude Density Ratios" table on page 6, we establish a factor of 0.598. Dividing the operating SP by this factor (1.5 ÷ 0.598) = 2.5" equivalent SP at standard air and density. By looking through the TCTS tables for fans that meet a performance of 11,000 CFM at 2.5" SP, we find:

FanSize	RPM	BHP	Blade Angle
21B6	2771	11.38	40°
24B5	2303	8.53	35°
28B6	1733	8.43	32°
30B4	2010	7.06	30°

Comparing these fans, we find that the 30B4 is the most efficient (lowest horsepower) selection. The horsepower shown above (often referred to as "cold" or "starting" horsepower) is the horsepower required at standard air density (0.075 lb/ft³). However, the actual BHP at the operating conditions of 150°F and 10,000 feet elevation will be $7.06 \times 5.98 = 4.22$ BHP.

Example 3: Select a TCVS fan, without a cone, for 10,000 CFM at 1.5" SP and a maximum outlet velocity of 2400 FPM at standard conditions (0.075 lb/ft³). Start by calculating the area required for 2400 FPM.

$$\text{Area} = \text{CFM} \div \text{OV} = 10,000 \div 2400 = 4.17 \text{ ft}^2$$

Using the cone and outlet dimensions from the table on page 14, we see that the outlet area for a 28" fan matches 4.17 ft² the closest without going under. Turning to page 8 for the 28B6 fan size and looking up 10,000 CFM @ 1.5" SP yields the following interpolated selection:

28B6 TCVS @ 1210 RPM @ 3.90 BHP @ 39° blade angle

Example 4: Using the same criteria as Example 3, 10,000 CFM at 1.5" SP and a maximum outlet velocity of 2400 FPM at standard conditions (0.075 lb/ft³), select a fan with a coned outlet.

Taking the next smaller fan size, 24B5, from the table on page 14 find the outlet area to be 3.19 ft².

$$\begin{aligned} \text{Velocity @ fan} &= 10,000 \div 3.192 = 3135 \text{ FPM} \\ \text{VP}_{\text{fan}} &= (3135 \div 1096.7)^2 \times 0.075 = 0.61 \text{ in. w.g.} \\ \text{VP}_{\text{cone}} &= (2400 \div 1096.7)^2 \times 0.075 = 0.36 \text{ in. w.g.} \\ \text{SP}_{\text{regain}}^* &= \text{VP}_{\text{fan}} - \text{VP}_{\text{cone}} = 0.61 - 0.36 = 0.25 \text{ in. w.g.} \end{aligned}$$

Turning to the table for a 24B5 TCVS on page 8 and looking up 10,000 CFM at 1.25" SP (1.5"-0.25"), through interpolation we find:

24B5 TCVS @ 1578 RPM @ 3.88 BHP @ 43° blade angle

We could continue in this method to the next smaller fan size, 21B6 (assuming the same cone to 2400 FPM). In this case, our static pressure including regain is 0.82" SP, which yields the following:

21B6 TCVS @ 1835 RPM @ 4.67 BHP @ 50° blade angle

An educated review would then determine the premium selection based on considerations of first cost vs. power consumption vs. space allotment, etc.

Please note that this explanation does not take into consideration any inherent ductwork or energy conversion losses. This exact $\text{SP}_{\text{regain}}$ amount should be factored by a predetermined percentage based on the actual cone geometry.

Performance Charts

The Arrangement 9 performance charts in this catalog are based on standard air density which is defined by AMCA as that of dry air of 70°F and sea level pressure (29.92 inches of mercury). This is equal to a density value of 0.075 lbs./cu.ft.

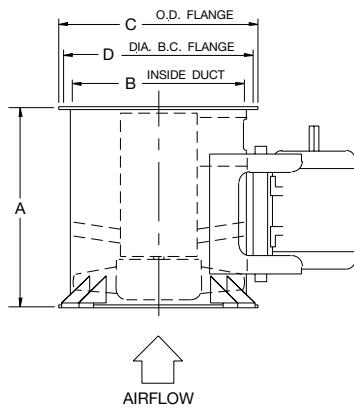

When required performance is at other than standard conditions, the values must be converted to equivalent standard values before entering the tables, and then

reconverted back to the actual conditions after the specific selection is made. The chart of temperature and altitude corrections above should be used for this purpose with Example #2 on page 5 displaying this procedure.

1003106 1003108
1003107 1003109

Fans shall be Model TCVS Vaneaxial or TCTS Tubeaxial, fixed pitch, steel wheel AXIFANS®, as manufactured by Twin City Fan & Blower, Minneapolis, Minnesota. Fans shall be Arrangement 9, V-belt driven with the wheel mounted on a separate shaft and bearings supported completely within an enclosed tube isolated from the high velocity airstream.

PERFORMANCE — Fans shall be tested and rated in accordance with industry accepted test codes and shall be guaranteed by the manufacturer to deliver rated published performance levels. Models TCVS and TCTS shall be available UL/cUL 705 listed. Models TCVSSH and TCTSSH shall be UL listed for Smoke Control Systems (500°F for 4 hours and 1000°F for 15 minutes).

HOUSING — Housings shall be welded of 14 gauge ASTM A-569 hot rolled steel in size 12" diameter, 12 gauge hot rolled steel in sizes 15" through 21" diameter, 10 gauge hot rolled steel in sizes 24" through 36" diameter, and 7 gauge hot rolled steel in sizes 42" through 54" diameter. Inlet and outlet flanges shall be of welded angle ring construction in fan sizes 12" and 15" diameter. In sizes 18" through 54" diameter inlet and outlet flanges shall be integrally rolled mechanically from fan housing sheet steel to insure concentricity and alignment of flanges. Concentricity of housings shall be insured through the use of welding jigs and fixtures. A fabricated adjustable steel motor support platform of minimum $\frac{3}{16}$ " steel plate shall be provided to offer infinite adjustment of belt tension.

Housings shall be fitted with mounting legs, hanging clips, or flange mounted as shown on the drawings. Fan mounting legs and clips shall be fabricated from minimum 12 gauge steel plate suitably braced to insure stability and rigidity.

Models TCVSSH and TCTSSH shall include a belt tube for the protection of belts and drive components from the airstream and a bolted access door.

GUIDE VANES — On Model TCVS fans the housing shall be fitted with aerodynamically designed stationary straightening guide vanes on the air discharge side of the wheel. The guide vanes shall be welded to both the inner cylinder and the fan housing interior. Guide vanes function to aid in the elimination of swirl and turbulence downstream of the fan thereby recovering rotational energy losses, improving efficiency and static pressure capability, and reducing fan noise generation.

WHEEL — The wheel shall be a fabrication consisting of die-formed stamped steel blades of single-surface airfoil shape welded to a spun steel central hub. Precise blade attachment shall be insured through the use of welding jigs and fixtures. The ability to provide various factory-set blade angles ranging from 30° to 50° allows the highest possible latitude in selection and provides fan operation at the highest possible efficiency.

All wheels are statically and dynamically balanced prior to assembly. Fans with motors and drives mounted by Twin City Fan & Blower are test run as a complete assembly and rechecked for balance at the specified operating speed.

SHAFT — Shafts shall be AISI 1045 hot rolled steel, accurately turned, ground, polished, and ring gauged for accuracy. Shafts shall be sized for the first critical speed of at least 1.43 times the maximum speed.

BEARINGS — Bearings shall be heavy duty, grease lubricated, anti-friction flange ball or roller, self-aligning, pillow block type and selected for a minimum average bearing life (AFBMA L-50) in excess of 200,000 hours at the maximum fan RPM. All bearings shall be provided with pre-filled factory extended lubrication lines terminating at the housing exterior to facilitate bearing relubrication without gaining access inside the ductwork.

DRIVE — The fan shall be equipped with a (fixed/adjustable) pitch V-belt drive selected to operate the fan at the correct operational RPM. The V-belt drive shall consist of cast iron sheaves and anti-static conducting belts and shall be selected with a (1.2/1.5) service factor based upon the required brake horsepower of the fan.

The complete fan shaft and bearing assembly shall be mounted within a steel fabricated inner cylinder. The V-belt drive assembly shall be extended through a two-piece belt fairing. The belt fairing shall be an aerodynamically shaped tube designed to maximize fan efficiency, minimize air blockage and reduce noise generation. The belt fairing shall be welded continuously to both the inner cylinder that houses the fan shaft and bearings and the fan housing, thus protecting and completely isolating the V-belt components from the direct blast of the airstream. Models TCVSSH and TCTSSH shall be equipped with a two-groove drive minimum.

MOTOR — Fan motors shall be manufactured in accordance with current applicable standards of IEEE and NEMA and, where applicable, shall meet current EPACT standards. They shall be foot-mounted, NEMA standard, (ODP, TEFC, Explosion-Proof), continuous duty, ball bearing type with class ("B", "F") insulation and of cast iron construction when commercially available.

FINISH AND COATING — The entire fan assembly, excluding the shaft, shall be thoroughly degreased and deburred before application of a rust-preventative primer. After the fan is completely assembled, a finish coat of paint shall be applied to the entire assembly. The fan shaft shall be coated with a petroleum-based rust protectant. Aluminum components shall be unpainted.

ACCESSORIES — When specified, accessories shall be provided by Twin City Fan & Blower to maintain one source responsibility.

FACTORY RUN TEST — All fans with motors and drives mounted by Twin City Fan & Blower shall be completely assembled and test run as a unit at the specified operating speed prior to shipment. Each wheel shall be statically and dynamically balanced in accordance with ANSI/AMCA 204-96 "Balance Quality and Vibration Levels for Fans" to Fan Application Category BV-3, Balance Quality Grade G6.3. Balance readings shall be taken by electronic type equipment in the axial, vertical, and horizontal directions on each of the bearings. Records shall be maintained and a written copy shall be available upon request.

GUARANTEE — The manufacturer shall guarantee the workmanship and materials for its TCVS and TCVSSH Vaneaxial or TCTS and TCTSSH Tubeaxial AXIFAN® Fans for at least one (1) year from startup or eighteen (18) months from shipment, whichever occurs first.
